

## **KYC Update data of client remotely**

### **Proposed System**

This system will help to reduce floods due to data update and has an advantage because considering security no data entered the system will be validated without confirmation of the client's data.

We will have login access for the client to update his data and after submitting the user with administrator profile validates the data and the client has no access to change without being granted access.

### **Benefits**

1. Only authorized person will be able to access these types of secured data and make necessary operations as per requirement.
2. Easily accessible through GUI based web application.
3. Facility of making correction and re-submit your data into the system
4. Friendly interface

### **Modules**

1. Internal user.
2. External user.

#### **Internal user:**

It's the collaborator or bank staff who will be responsible to approve the information's or data inserted by the customer in order to update the documentations.

#### **External user:**

Is the customer with the right to insert and upload his document for updating purpose without even be in a queue. This can be done remotely
